

## Philadelphia Department of Public Health Seasonal Influenza Surveillance Report

February 1 - February 7, 2015 (Week 5)

## Philadelphia Influenza Activity

Please note these data are provisional and subject to change.

Influenza activity in Philadelphia appears to be decreasing as 64 influenza-associated hospitalizations from local hospitals were reported for the week of February 1—7, 2015. During the same week, 108 reports of laboratory-confirmed influenza A were detected at our 6 participating clinical laboratories, a sharp decline from the previous week's totals. Influenza-like illness (ILI) activity at emergency departments also decreased compared to the previous week, while ILI at pediatric ambulatory clinics also increased slightly. Thirty-six outbreaks of influenza have been reported in long term care facilities. Two influenza-associated pediatric mortalities occurred in Philadelphia, one in week 4 and one in week 5. *PDPH requests that any influenza cases presenting with parotitis be specifically reported. Due to low vaccine effectiveness this season, providers are reminded to treat all hospitalized and high-risk patients suspected to have influenza with antiviral medicine.* 

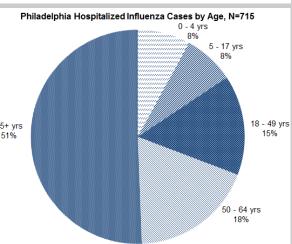

Surveillance type	Compared to week of 1/25- 1/31	Compared to 3-yr seasonal* mean
Hospital ED Fever/flu visits	<b>↓</b>	1
Pediatric Clinics ILI	<b>↑</b>	_
Laboratory Influenza Surveillance	<b>↓</b>	1

↑ = above 10 % of comparison group

↓ = below 10 % of comparison group

= equivalent to comparison group (-10% to +10%)

\* mean of 2007-'08, 2008-'09, and 2010-'11 flu seasons

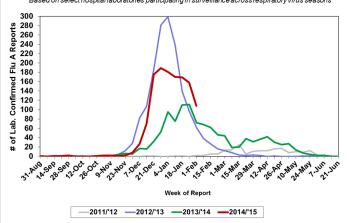

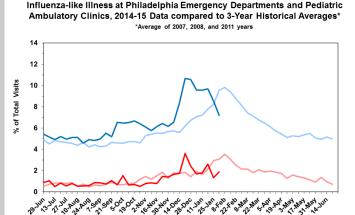

Influenza activity continues to be categorized as widespread during week 5 in Pennsylvania. A total of 43,127 cases of influenza (positive by any test type) have been reported as of February 7,2015. A majority (93.5%) of the cases sub-typed at the state public health lab thus far this season have been associated with influenza A/H3 and 6.5% have been classified as other sub-types. A total of 162 influenza-associated deaths have occurred in Pennsylvania. Of the 162 influenza-associated deaths in PA, two were among the ages of 0-18, four were among the ages of 25-49, fourteen were among the ages of 50-64, and 142 were among people greater than 65 years of age. Thirteen deaths with positive influenza tests were reported in Philadelphia.

## **United States**

During week 5 influenza activity decreased, but remained elevated in the U.S. Nationwide, 3.8% of outpatient visits were due to ILI, which is above the national baseline (2.0%). Widespread activity was reported by Puerto Rico and 32 states, including New Jersey, Delaware, and New York. The U.S. Virgin Islands, Guam, and 16 states reported regional influenza activity. Local activity was reported by the District of Columbia and two states (Alaska and Minnesota). Of the 21,340 specimens tested and reported by WHO/NREVSS collaborating laboratories during week 5, 3,174 (14.9%) were positive for influenza, of which 2,768 (87.2%) were influenza A and 406 (12.8%) were influenza B. Of the 2,768 positive influenza A specimens, 6 (0.2%) were categorized as 2009 H1N1, while 1,058 (38.20%) were H3. Subtyping was not performed on the other 1,704 (61.6%) specimens. In the U.S., the vast majority of recently circulating influenza viruses have been susceptible to the neuraminidase inhibitor antiviral medications; however, rare sporadic instances of oseltamivir-resistant A(H1N1)pdm09 and A(H3N2) viruses have been detected worldwide. Of all deaths reported during week 5, 8.1% were due to pneumonia and influenza, which is above the epidemic threshold for week 5 (7.2%). A total of 80 pediatric deaths have been reported for the 2014-2015 season from New York City and 28 states.
