REPORT TO THE PRESIDENT ON COMBATING ANTIBIOTIC RESISTANCE

Executive Office of the President
President's Council of Advisors on
Science and Technology

September 2014

PCAST Report on Antibiotic Resistance

- ◆ **Improve surveillance of the rise of antibiotic-resistant bacteria**
 - Enable effective responses
 - Stop outbreaks
 - Limit transmission
- ◆ **Increase the longevity of current antibiotics**
 - Prevent spread of multidrug-resistant organisms
 - Limit emergence of antibiotic resistance
- ◆ **Increase the rate of discovery of new antibiotics and the development of innovative interventions**
- ◆ **Federal investment**
 - Double current investment in surveillance, stewardship, research and clinical development
 - \$450 to \$900 million annually
 - Incentivize commercial development
 - Additional \$800 million annually

1. Ensure Strong Federal Leadership

- ◆ **Task the National Security Council with oversight and coordination of Federal efforts to combat resistance**
- ◆ **Appoint a White House Director for National Antibiotic Resistance Policy**
 - Develop an integrated National Action Plan
- ◆ **Establish Interagency Task Force on Combating Antibiotic-Resistant Bacteria**
- ◆ **Establish a Joint Scientific Working Group on Human Antibiotic Resistance**
- ◆ **Establish a President's Advisory Council on Combating Antibiotic-Resistant Bacteria**

2. Effective Surveillance and Response

- ◆ **Strengthen state and local public health infrastructure for surveillance and response**
 - \$90 million in new funding for CDC annually
 - \$60 million for state grants
 - \$30 million to address community antibiotic resistance threats
- ◆ **Establish national capability for surveillance based on genomic analysis**
 - National laboratory network
 - Reference collection of genome sequences
 - Develop new computational methods and tools
 - Publicly accessible database with analytical tools
 - Surveillance efforts in diverse settings
 - Develop surveillance and testing standards
 - \$190 million annually

3. Fundamental Research

- ◆ **Develop new antibiotics and alternatives for treating bacterial infections**
- ◆ **Develop alternatives to antibiotics in agriculture**

4. Clinical Trials with New Antibiotics

- ◆ **Establish a robust national infrastructure to support clinical trials of new antibiotics**
- ◆ **Develop new regulatory pathways to evaluate urgently needed antibiotics**

5. Increase Economic Incentives for Developing Antibiotics

- ◆ **Direct Federal funding**
- ◆ **Economic rewards for drug development**
 - Higher reimbursement (CMS)
 - Delinking antibiotic use from revenues (antibiotic incentive fund)
 - Extend patent life or market exclusivity of another drug
 - Antibiotic usage fee (gasoline or cigarette tax)

6. Improve Antimicrobial Stewardship

◆ Definition

- Systematic efforts to optimize the use of antibiotics to maximize benefits, minimize resistance and decrease adverse events

◆ Only 50% of hospitals have implemented antimicrobial stewardship programs

- Barriers: Other priorities, staffing constraints and insufficient funding

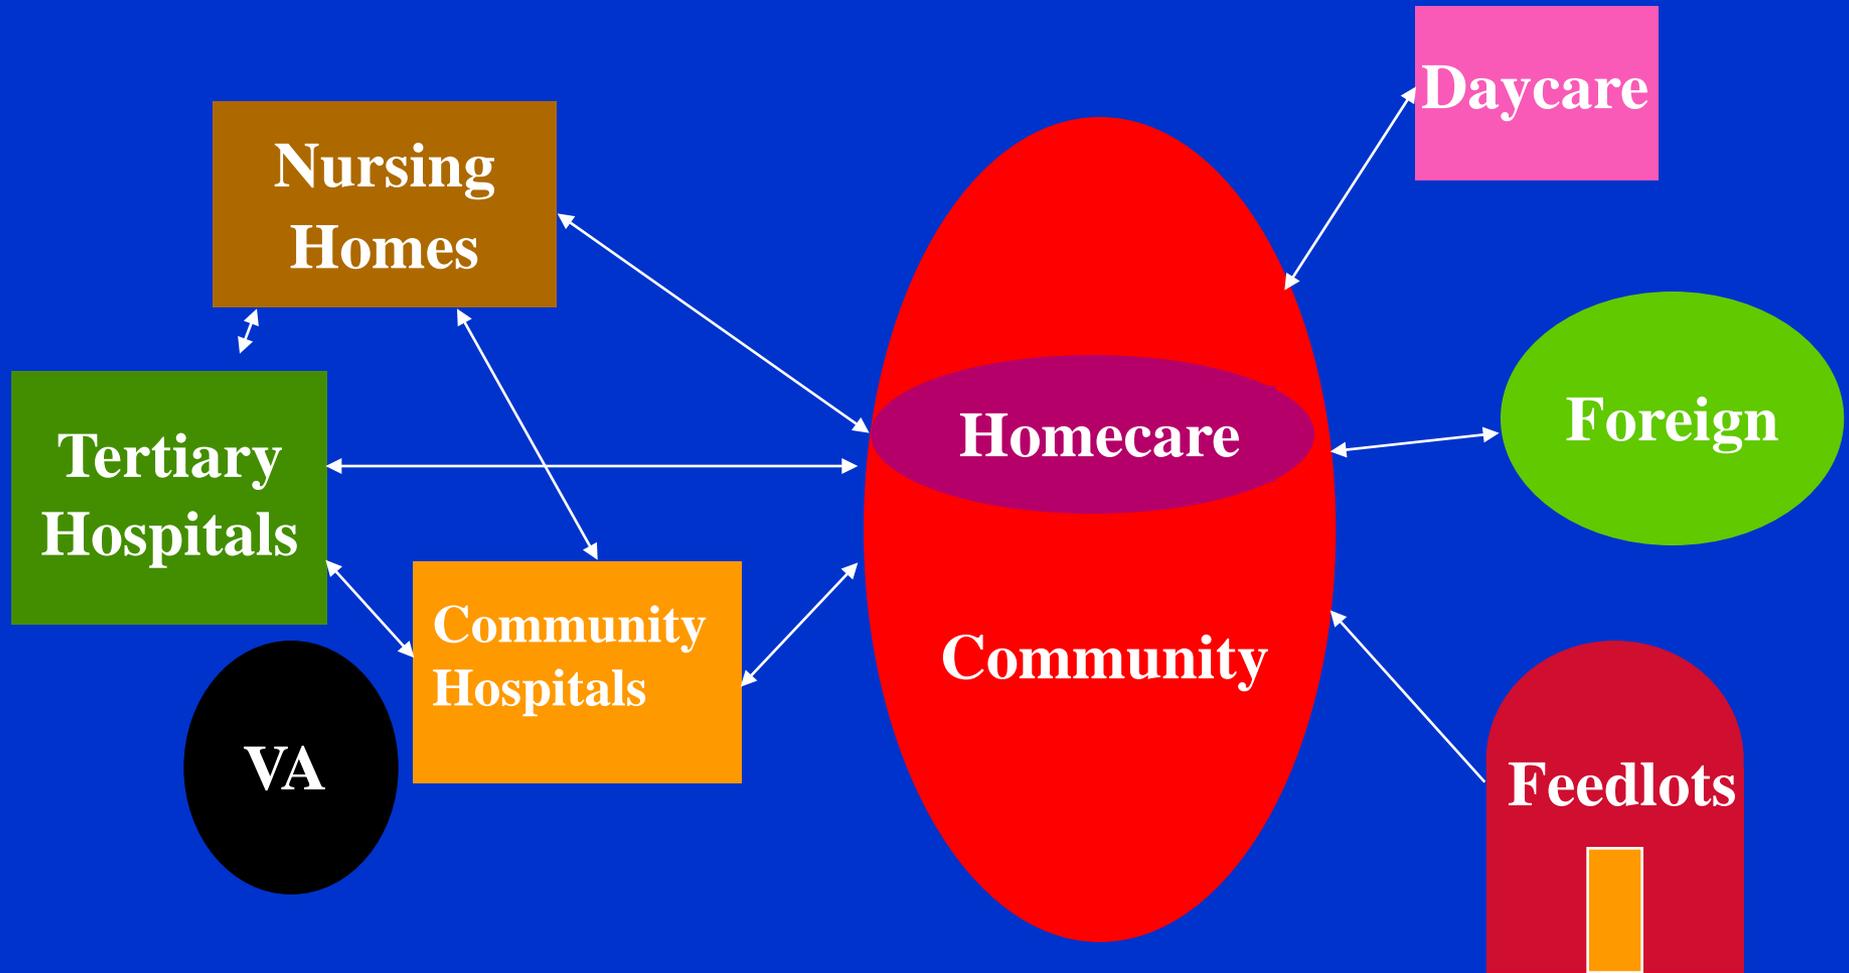

◆ Acute and ambulatory settings

- Efforts in ambulatory care lag behind hospital-based efforts
- Sustained improvement usually requires ongoing interventions*

*Gerber JS et al. JAMA 2013. 309:2345-52.

Arnold SR and Straus SE. Cochrane Database of Systematic Reviews, 2005.

Environments Where Antibiotic Resistance Develops and Their Relationships

Adapted from B. Murray

Antimicrobial Stewardship as a CMS CoP

- ◆ **CMS Condition of Participation by the end of 2017**
 - Antimicrobial Stewardship Officer
 - Institutional policies for appropriate use
 - Identify areas for improvement
 - Implement interventions
 - Measure and report antibiotic use
 - Leadership support to address problems (CEO, CMO, CNO)
- ◆ **Work with CDC and other content experts to develop Interpretive Guidelines**
- ◆ **Acute care hospitals, critical access hospitals, long-term care and nursing home facilities**
- ◆ **Phased in rapidly for other settings:**
 - Long-term acute care hospitals
 - Other post-acute care facilities
 - Ambulatory surgical centers
 - Dialysis centers

Stewardship in Ambulatory Settings

- ◆ **Expand Physician Quality Reporting System (PQRS) to include measures that discourage inappropriate use**
 - Non-bacterial infections
 - Respiratory tract infections
- ◆ **Currently voluntary**
 - Incentive to participate
 - Penalty for nonparticipation
- ◆ **Antibiotic reporting module should be mandatory**

Measuring Antibiotic Usage and Resistance

- ◆ **Reporting to NHSN Antibiotic Use and Resistance (AUR) module should be mandatory**
 - Results should be reported on Hospital Compare
 - Integrated into Value Based Purchasing
 - Submit to consensus body for endorsement and implementation by 2017
 - National mandatory implementation by 2020

Additional Support for AS

- ◆ **Federal agencies should require implementation of ASPs as a condition for receiving any Federal funding**
 - Healthcare delivery
 - Community Health Care Centers
- ◆ **Federal agencies should provide technical assistance**
- ◆ **Federal government should lead by example**
 - Veterans Administration facilities
 - Department of Defense
 - Health and Human Services
 - Indian Health System

Antimicrobial Stewardship Research Support

- ◆ **Design and implementation of most effective strategies**
- ◆ **Behavioral economics**
- ◆ **Engage care providers, patients and public at large**
- ◆ **Best mechanisms for patient education**
- ◆ **Development and interpretation of rapid point of care diagnostics**
 - Global Challenge Inducement Prizes

REVIEW ARTICLE

Antimicrobial Stewardship Programs in Inpatient Hospital Settings: A Systematic Review

Brittin Wagner, PhD;^{1,2} Gregory A. Filice, MD;^{2,3} Dimitri Drekonja, MD, MS;^{2,3} Nancy Greer, PhD;¹ Roderick MacDonald, MS;¹ Indulis Rutks, BS;¹ Mary Butler, PhD, MBA;⁴ Timothy J. Wilt, MD, MPH^{1,2}

-
- ◆ **Improve prescribing**
 - ◆ **Improve microbial outcomes**
 - ◆ **Little data on patient outcomes**
 - Mortality
 - LOS
 - Readmissions
 - ◆ **Strength of evidence was low**

Behavior

“You don't understand us
So don't reprimand us”

The Police

Understanding the Determinants of Antimicrobial Prescribing Within Hospitals: The Role of “Prescribing Etiquette”

E. Charani,¹ E. Castro-Sanchez,¹ N. Sevdalis,^{2,3} Y. Kyratsis,¹ L. Drumright,¹ N. Shah,¹ and A. Holmes¹

- Qualitative semi-structured interviews with doctors, pharmacists, nurses/midwives in 4 teaching hospitals (n=39)
- Three themes related to prescribing etiquette

- **Decision-making autonomy**
 - Senior doctors make whatever decisions they want and no one questions it
 - One doctor does not want to interfere with another doctor's decision
- **Limitations of local evidence-based policies**
 - Doctors frequently consider their patients to be outside the boundaries of local guidelines
 - Doctors are “above” the guidelines because of experience and expertise
- **Culture of hierarchy**
 - Senior doctors decide what is prescribed and junior doctors do not challenge it

Changing Prescriber Behavior

- Engagement of senior leadership (clinical and administrative) is critical
- Address stewardship message to the clinical leadership within existing clinical groups (rather than just the trainees or the ID doctors)
- Understand local culture and patient population

Prolonged Antibiotic Treatment in Long-term Care

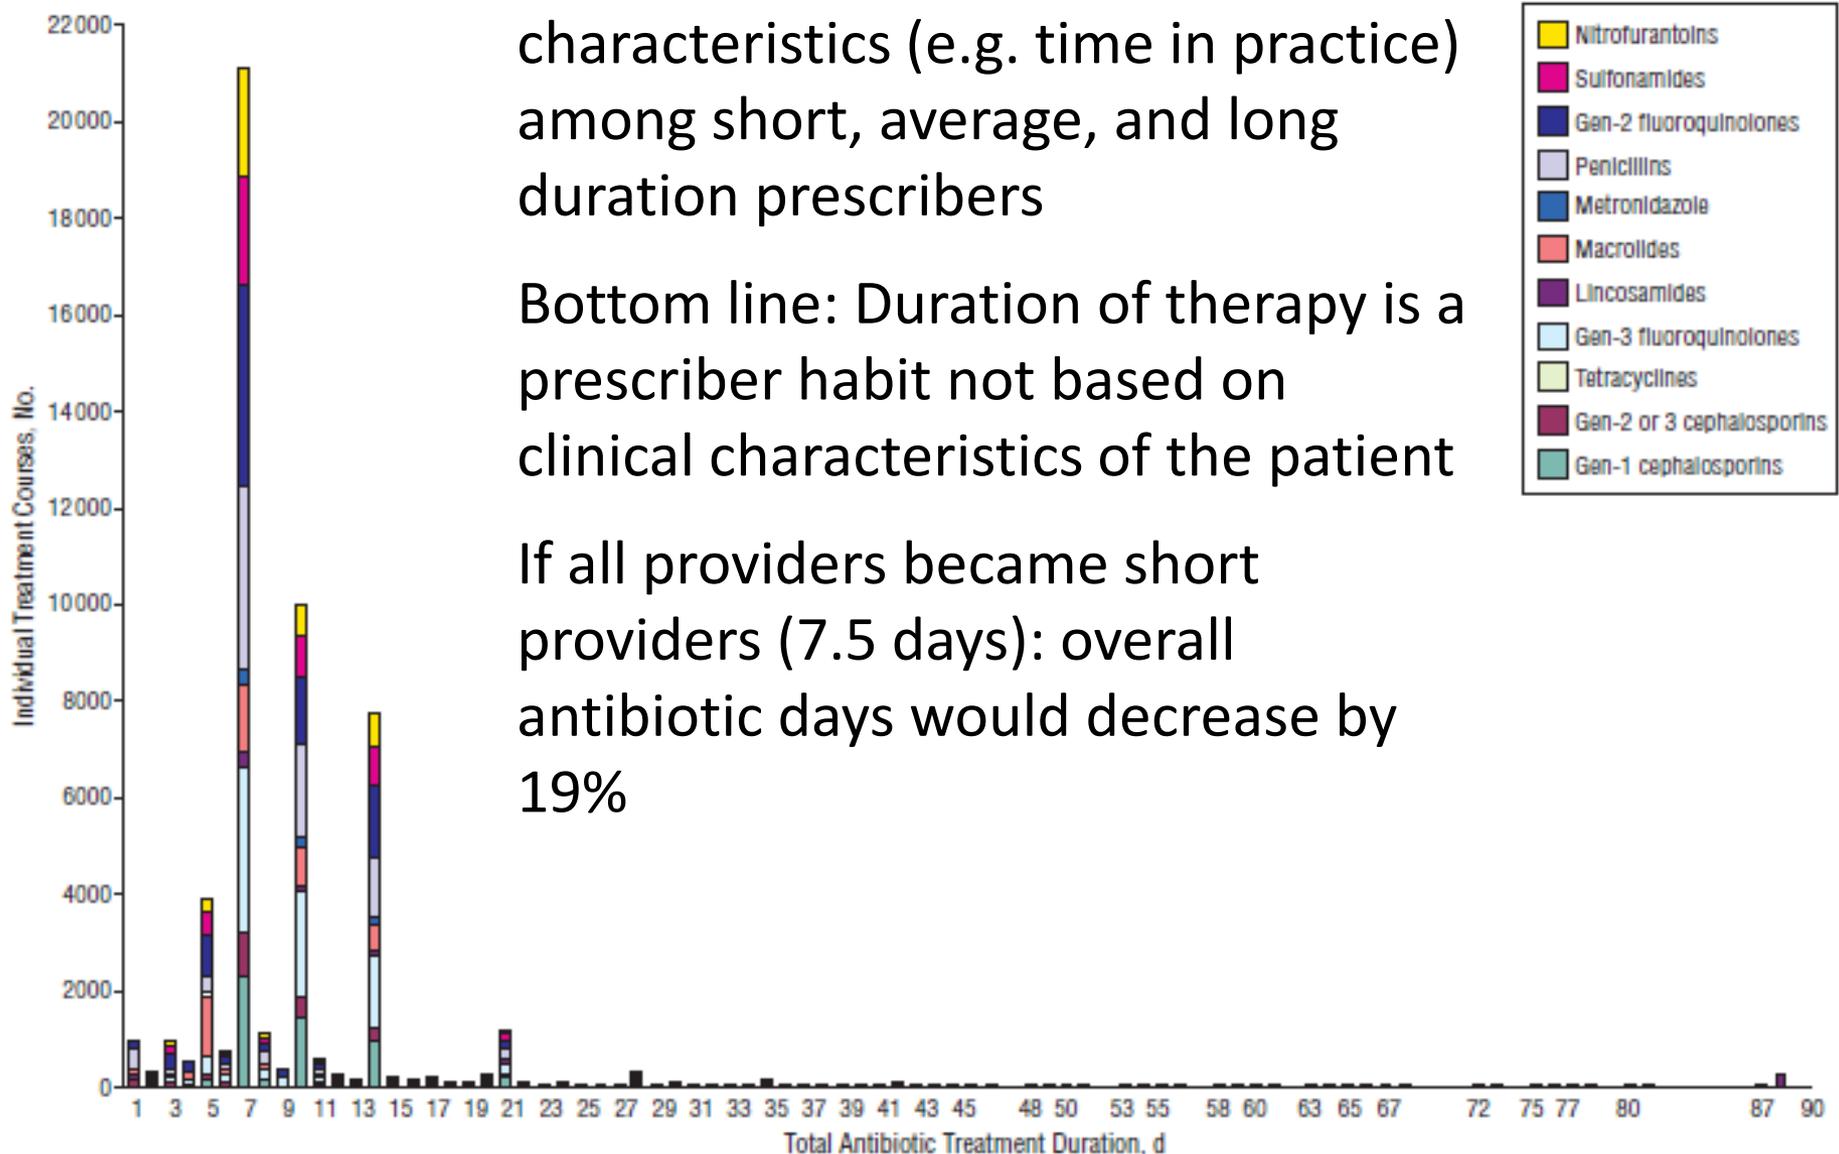

Role of the Prescriber

- Assessment of antibiotic prescribing patterns in 50,061 LTCF residents in 2010
- Most common antibiotics: FQ and penicillins
- Most common course: 7 days
 - BUT 45% were > 7 days and only 14% were < 7 days
- Providers divided into short (5-7 days, n=152), average (10 days, n=402) and long (14 days, n=145) duration prescribers

No significant differences in provider characteristics (e.g. time in practice) among short, average, and long duration prescribers

Bottom line: Duration of therapy is a prescriber habit not based on clinical characteristics of the patient

If all providers became short providers (7.5 days): overall antibiotic days would decrease by 19%

Summary

- **Changing prescriber behavior is a key factor in improving antibiotic use in the long term**
 - Need to evolve from top down stewardship approach to a bottom up approach
- **But, changing behavior is hard and the solution most likely multi-factorial**
 - More emphasis on shorter duration given expanding evidence base
 - Enhancing comfort level with new rapid microbiology approaches
 - Benchmarking and feedback at institutional and provider level
 - Need to engage senior leadership

7. Stewardship in Animal Agriculture

- ◆ **FDA should proceed with vigorous implementation of Guidances 209 and 213**
- ◆ **FDA should monitor sales and usage of antibiotics**
- ◆ **Additional measures to protect human health as needed**

State Initiatives

- ◆ **California Senate Bill 739**
- ◆ **California Senate Bill 1311**

California Antimicrobial Stewardship Program Initiative

California Senate Bill 739

Mandated that, by January 1, 2008, CDPH require general acute care hospitals to develop a process for the judicious use of antibiotics and monitor antibiotic use by a quality improvement committee

<http://www.cdph.ca.gov/programs/hai/Pages/AntimicrobialStewardshipProgramInitiative.aspx>

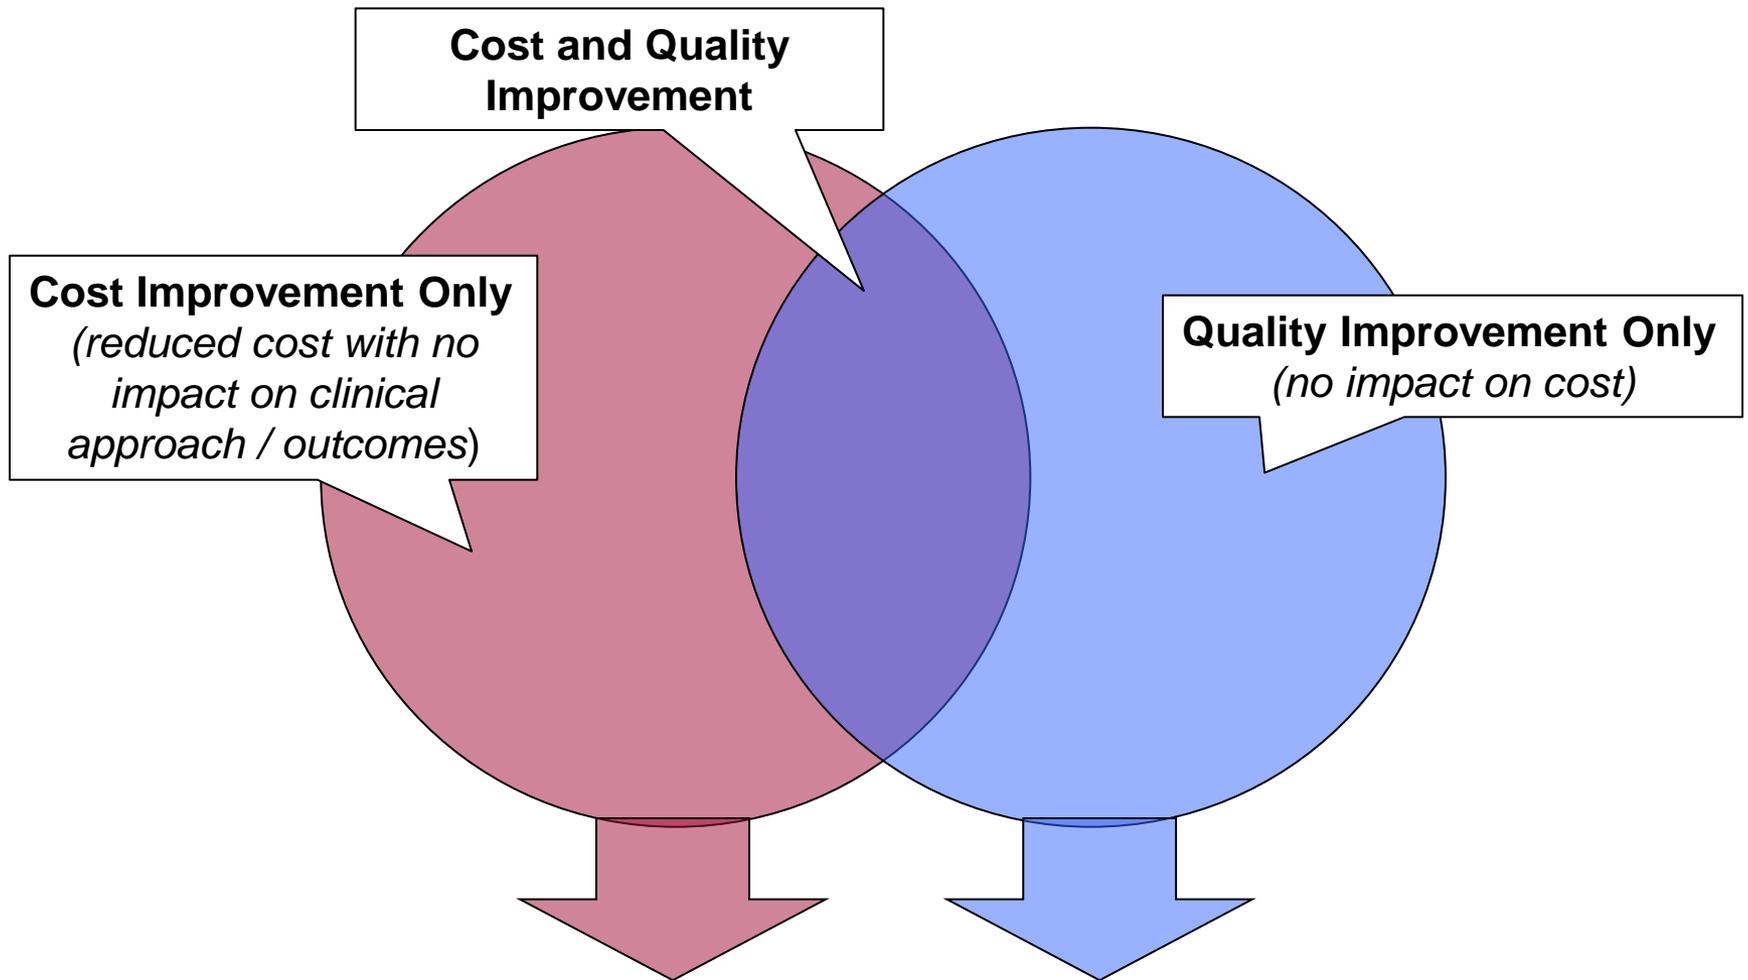

California Senate Bill 1311

- ◆ **All general acute care hospitals must develop and implement an Antimicrobial Stewardship Program by July 1, 2015**
- ◆ **Physician supervised multidisciplinary committee**
- ◆ **At least one physician or pharmacist in the group must be trained**
 - Completed training in Antimicrobial Stewardship (CDC, SHEA)
- ◆ **Report to Quality Committees at the institution**

Making the Case

- ◆ **Antibiotics are among the most commonly prescribed drugs in human medicine**
- ◆ **Antibiotics have an ecological impact**
- ◆ **Up to 50% of all antibiotics prescribed in the US are not needed or are not optimally prescribed**
- ◆ **The annual economic impact of antibiotic resistance in the US is \$55-70 billion**
 - \$20-35 billion in excess direct health care costs
 - Loss of productivity valued at \$35 billion annually
 - 8 million additional hospital days annually
 - 2 million people infected per year
 - 23,000 deaths annually
- ◆ **30% reduction in antibiotic resistance would save \$20 billion per year**
 - Reduce Medicare expenditures

What is Value?

Exploration in Parallel by Finance and Quality Improvement

Summary: Measurement in Antimicrobial Stewardship

- Measure something!
- Process measures
 - Antimicrobial use
 - Appropriateness of use
- Outcomes
 - Antimicrobial resistance
 - Costs
 - *C. difficile*
 - Mortality
 - Time to proper therapy
 - Length of stay (and possibly readmission)
 - Adverse drug events
- Focus on value and decreasing clinical variations in care

Conclusions

- **Options for measurement**
 - Should always measure antibiotic use over time in some way
 - Outcome measures are compelling to clinicians and should be measured if feasible
 - There should be a plausible relationship between changes in antimicrobial use and the outcome measure to attribute the result to stewardship activities
- **Benchmarking across institutions**
 - Provides useful information for a program to compare itself to peers and develop improvement strategies
 - Will likely become commonplace in the future
 - AUR Module
- **Demonstrate value**
 - Decreased clinical variations in care

Making the Case

- ◆ **Healthcare quality**
- ◆ **Patient safety**
- ◆ **Value**
- ◆ **Read the PCAST Report**
 - ◆ **It is the future!**
